AKANSH MOWAR

DEVOPS / PLATFORM / CLOUD ENGINEER

Building and operating systems that move software safely from code to production.

SUMMARY

DevOps engineer on an enterprise banking platform at Barclays, working across OpenShift, Kubernetes, Helm and GitLab CI/CD. Day to day: release engineering, containerised workloads, security gates and platform modernisation.

3+ years of experience. Comfortable owning a release end to end — pipeline, image, chart, secret material, database migration and promotion — and applying SRE-aligned engineering practices to keep the runtime predictable.

EXPERIENCE

DevOps Engineer · Barclays

JULY 2023 – PRESENT · PUNE, INDIA

Enterprise banking / liquidity platform.

50+
independently deployable microservices, across the wider platform

30+
standardised containerised workloads, built and operated to one shape

20+
stage GitLab CI/CD release workflow, from artifact retrieval to controlled promotion

- Own and operate a 20+ stage GitLab CI/CD release workflow: artifact retrieval from Nexus, testing, security scanning, Docker image builds, certificate and JKS updates, PostgreSQL schema and incremental migrations, Helm deployments and controlled image promotion.
- Build and operate 30+ standardised containerised workloads on Red Hat OpenShift 4.x — Deployments, Services, Routes, ConfigMaps, resource limits and readiness, liveness and startup probes.
- Work across a platform of 50+ independently deployable microservices, keeping deployment shape consistent between them through Helm charts.
- Enforce security gates in the pipeline with SonarQube and Veracode at source and build, Trivy on images, and HashiCorp Vault and OpenShift Secrets for secret material.
- Support the runtime: messaging with Kafka and IBM MQ, data on PostgreSQL and Hasura, edge with Nginx, and observability through ELK, Observe and AppDynamics.

STACK Red Hat OpenShift 4.x · Kubernetes · Helm · GitLab CI/CD · Docker · Nexus · Java 17 · Tomcat 10 · Nginx · Hasura · PostgreSQL · Kafka · IBM MQ · HashiCorp Vault · OpenShift Secrets · SonarQube · Veracode · Trivy · ELK · Observe · AppDynamics

Cloud Engineer Intern · CloudNXT

MAY 2022 – AUGUST 2022 · PUNE, INDIA

Azure infrastructure operations.

- Monitored 100+ Azure virtual machines.
- Supported disaster recovery drills.
- Ran Azure Snapshot backups.
- Supported provisioning, configuration and patching.

STACK Microsoft Azure · Azure Snapshots · Disaster recovery drills

EDUCATION

B.Tech, Computer Science — JULY 2019 – MAY 2023

University of Petroleum and Energy Studies (UPES) — Dehradun, India

Specialisation: Cloud Computing & Virtualization Technology

CERTIFICATIONS

AZ-104 — Azure Administrator Associate	MICROSOFT
AZ-900 — Azure Fundamentals	MICROSOFT
Cloud Practitioner	AWS

In preparation, not certified: CKAD (CNCF).

PLATFORM MODERNISATION

Five layers replaced under a service that had to keep running.

LAYER	BEFORE	AFTER	WHAT IT BOUGHT
Delivery	~~Jenkins + Bitbucket~~	GitLab CI/CD	one system for source, pipeline and registry access
Deployment	~~Raw manifests~~	Helm charts	the same deployment shape for every workload
Runtime	~~JDK 8~~	Java 17	supported runtime, current security patches
App server	~~JBoss~~	Tomcat 10	lighter images, faster container start
Observability	~~ELK~~	Observe	one place to ask what the platform is doing

PROJECTS

Migration Assurance Platform — PERSONAL PROJECT

A GitOps delivery path on AWS: the pipeline only ever produces an image, and the cluster only ever follows Git.

- The pipeline pushes images. It does not touch the cluster.
- Git holds the desired state; Argo CD closes the gap continuously.
- Terraform builds the structure and carries no runtime traffic.
- The image that was scanned is the image that runs.

Stack — AWS · Amazon EKS · Amazon ECR · Application Load Balancer · Terraform · Argo CD · GitLab CI/CD · Docker · GitOps

Career Autopilot — PERSONAL PROJECT

A legacy monolith taken apart one service at a time, with traffic never stopping.

- 16-service architecture extracted from a monolith one service at a time, in a monorepo with per-service Dockerfiles and multi-stage Docker builds.
- Per-service build, test and deploy driven by path-based change detection, so only what changed is rebuilt.
- API Gateway routing in front of the services. If a service is not migrated yet — or is not answering — routing falls back to the monolith.

Stack — Monorepo · Per-service Dockerfiles · Multi-stage Docker builds · Per-service build / test / deploy · Path-based change detection · API Gateway routing · Vercel frontend

Services are drawn as numbered units. The count and the pattern are real; the names are not published here.

TECHNICAL SKILLS

CONTAINERS & ORCHESTRATION	Red Hat OpenShift 4.x · Kubernetes · Helm · Docker · Amazon EKS · Multi-stage builds · Readiness / liveness / startup probes · NGINX Ingress · cert-manager
CI/CD & RELEASE	GitLab CI/CD · Argo CD · Nexus · Jenkins · Bitbucket · GitHub Actions · Git · Controlled image promotion · Schema & incremental migrations · Certificate & JKS updates
CLOUD	AWS — EKS, ECR, Application Load Balancer · Microsoft Azure — virtual machines, snapshots, DR drills · Red Hat OpenShift
INFRASTRUCTURE AS CODE & AUTOMATION	Terraform · GitOps workflows · Ansible · Bash · Python · Vercel
SECURITY & SECRETS	HashiCorp Vault · OpenShift Secrets · SonarQube · Veracode · Trivy · Secrets management
RUNTIME, BUILD & DATA	Java 17 · Tomcat 10 · Nginx · PostgreSQL · Hasura · Kafka · IBM MQ · Maven · Gradle
OBSERVABILITY	Observe · ELK · AppDynamics · Prometheus · Grafana · Netcool
